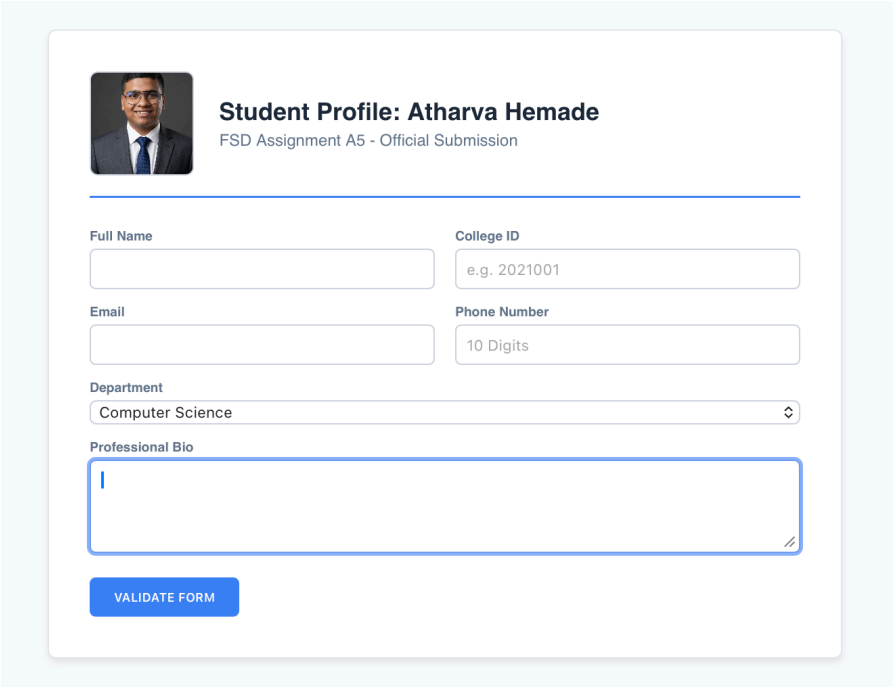
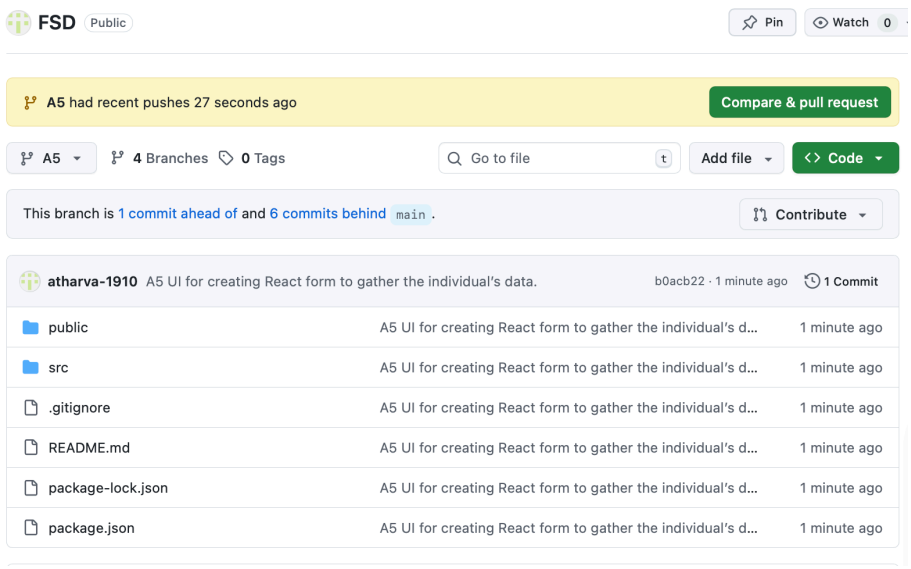
The development followed a standard industry workflow:




1. **Environment Setup:** Initialized the project using `create-react-app`.
2. **Asset Management:** Local image assets (profile headshot) were integrated into the `src` directory and imported as modules.
3. **Git Branching:** A dedicated feature branch named **`A5`** was created to isolate the assignment code from the main branch.
4. **Remote Deployment:** The project was pushed to the GitHub repository [atharva-1910/FSD]() for evaluation.
